## IAP Committee on Immunisation

THE DEFINITIVE GUIDE TO VACCINATION IN INDIA

Immunisation is one of the most cost-effective health interventions known to mankind. In the relatively short time that we have used this tool, small pox has been eradicated and we are at the threshold of eliminating polio.

*The Indian Academy of Pediatrics (IAP) publishes a Guide Book on Immunisation, for the guidance of its members. It is meant to guide vaccination efforts in India, taking into account the disease prevalence, health priorities, and resource allocation possible. This website presents the key recommendations of the IAP Committee on Immunisation.*

The recommendations here are the 'best individual practices schedule' for a given child and would necessarily be at some variance from the National Immunisation Schedule of the Government of India, which is meant for the public at large. With the availability of many newer vaccines, it is necessary that some of these should be considered for routine immunisation and the immunisation schedule has to be changed accordingly. From time to time, updates to the recommendations of the latest Guidebook will be published on this site.

### IAPCOI TEAM 2011 -2013

#### **Chairpersons:**

Dr. T. U. Sukumaran  
Dr. Rohit C. Agrawal

#### **Convener:**

Dr. Vipin M. Vashishtha

#### **Members:**

Dr. Amarjeet Chitkara  
Dr. Manjori Mitra  
Dr. S. Sanjay  
Dr. S. G. Kasi

CASE DEFINITIONS

REPORT A CASE

REPORT AN AEFI

## Welcome

Indian Academy of Pediatrics in collaboration with its Kutch branch has started Infectious Disease Surveillance for Vaccine Preventable Diseases (VPDs) and AEFI (Adverse Event Following Immunization) reporting system for reporting Severe AEFI. The Objectives of the project are to develop an early warning system for pediatric infectious diseases in India, to generate data on burden of infectious diseases in India and to generate data on severe AEFI. The standard case definitions for all the diseases covered under this project are provided on the website. All the cases reported through various methods are collected in a single database in real time and reports are sent to all users on weekly basis. In case a disease outbreak is recorded on the system, email and SMS alert are sent to all users instantaneously.
